

Supplementary Material I. Potential Hazards Database

Potential hazards associated with carbon capture and storage (CCS) are summarized in the table below. These include hazards associated with the four main components of CCS – capture, transportation, injection, and storage – as well as general hazards associated with CCS overall. To the extent possible, the probability and consequences of these hazards are indicated in the table as well. These results provide an overview of the types of hazards that warrant consideration in developing risk management strategies for CCS. The information on probability and consequences may also be used to characterize the risk associated with each of these hazards.

(To accompany: Sarkarfarshi M, Ladubec C, Gracie R, Dusseault MB, Leiss W, Krewski D. 2019. Potential technical hazards associated with four North American ... Int. J. Risk Assessment and Management, 22 (3/4), 359-383

Activity	Hazardous Events			Consequence	Reference	Probability	Reference	Magnitude	Reference
	Event	Description	Reference						
General	Hazardous Material Spill	Hazardous materials might be required during the project, either for construction or operation of the systems.	(Shell Canada Limited, 2010a, pp.17-4), (U.S. Department of Energy, 2007, pp.S-67~68)	Liquids such as lubricates, antifreezes, drilling mud and workover fluid may contain toxic, flammable or explosive components.	(Shell Canada Limited, 2010a, pp.17-4)	Unlikely Low	(Shell Canada Limited, 2010a, pp.17-4), (U.S. Department of Energy, 2007, pp.S-82)	Adverse effect on general population <5000 m from site	(U.S. Department of Energy, 2007, pp.S-76)
General	Catastrophic accidents such as plant explosion, attack or sabotage	Exposure to CO, H ₂ S, SO ₂ , SO ₃	(U.S. Department of Energy, 2007, pp.S-75)	Negative consequences to human health depend on exposure time and vary from no health effects to life-threatening. No health effects for CO ₂ levels below 5000 ppm.	(U.S. Department of Energy, 2013, pp.3.17-5)	Probability of attack / sabotage unknown. Probability of explosion during construction is low.	(U.S. Department of Energy, 2013, pp.3.17-37), (U.S. Department of Energy, 2013, pp.3.16-5)	CO exposure: 2 to 26 irreversible accidents, 0 to 4 life threatening accidents SO ₂ exposure: 2 to 19 irreversible accidents, 1 to 10 life threatening accidents H ₂ S exposure: 12	(U.S. Department of Energy, 2007, pp.S-75,76,105)

Capture	Affecting Air quality	<p>Emissions from the project in various phases can affect the air quality.</p> <p>Change to ambient nitrogen dioxide (NO₂) and respirable particulate matter (PM_{2.5}) concentration</p>	<p>(Shell Canada Limited, 2010b, pp.8-1,2),</p> <p>(Shell Canada Limited, 2010a, pp.14-4)</p>	Human short term and long-term exposure	(Shell Canada Limited, 2010a, pp.14-10)	Risk of cancer (not probability only) of 0.022x10 ⁻⁶ to 0.222x10 ⁻⁶	(U.S. Department of Energy, 2007, pp.S-102)	<p>Negligible, excepted exposure to NO₂ for people in the industrial project area</p> <p>NO₂ concentrations is likely to be low enough so that it does not affect people with asthmatics PM_{2.5} concentration seems not to have a considerable environmental effect. Maximum PM_{2.5} annual and 24-hr increase are 0.038 and 0.524 µg/m³, respectively.</p> <p>PM_{2.5} concentrations above are well below 5.8 µg/m³ and have no impact on human mortality.</p>	(Shell Canada Limited, 2010a pp.14-13,14,16,17), (U.S. Department of Energy, 2007, pp.S-78), (Evans et al., 2013)
Capture	Process upsets in the capture system	<p>CO₂ leakage in the capture system from locations other than the vent.</p> <p>Affecting air quality specially during unplanned restarts as a result of plant upset.</p>	<p>(Shell Canada Limited, 2010a, pp.17-3), (U.S. Department of Energy, 2007, pp.S-77)</p>	<p>impairing effects on air quality and public health and safety</p> <p>Exhausting the vent to the atmosphere which releases the pollutants into the air.</p>	(Shell Canada Limited, 2010a, pp.17-3), (U.S. Department of Energy, 2007, pp.S-77)	0.001 events per year	(Shell Canada Limited, 2010a, pp.17-11)	Less than failure of the pipeline	(Shell Canada Limited, 2010a, pp.17-3)

Activity	Hazardous Events			Consequence	Reference	Probability	Reference	Magnitude	Reference
	Event	Description	Reference						
Transportation	Third party accidents	Accidents can compromise the integrity of the pipeline.	(U.S. Department of Energy, 2013, pp.3.17-37)	CO ₂ leakage	(U.S. Department of Energy, 2013, pp.3.17-37)	1.88 x 10 ⁻³ per year for a 30 mile pipeline in Morgan County	(U.S. Department of Energy, 2013, pp.3.17-24)	Small (because of leakage detection system in the pipeline)	(Shell Canada Limited, 2011c, pp.4-100,101)
Transportation	Failure of pipeline	Due to frost heave	(Quintessa, 2012)	CO ₂ leakage				Small (because of leakage detection system in the pipeline)	(Shell Canada Limited, 2011c, pp.4-100,101)
Transportation	Failure of the pipeline	Due to landslides	(Quintessa, 2012)	CO ₂ leakage				Small (because of leakage detection system in the pipeline)	(Shell Canada Limited, 2011c, pp.4-100,101)
Transportation	Failure of the pipeline (or injection well head)	Release of CO ₂ Release of H ₂ S	(Shell Canada Limited, 2011c, pp.4-87), (U.S. Department of Energy, 2007, pp.S-73)	Adverse effects on groundwater, surface water, soil, plants, animals and public health and safety	(Shell Canada Limited, 2011c, pp.4-87), (Shell Canada Limited, 2010a, pp.17-3), (U.S. Department of Energy, 2007, pp.S-84)	Low 0.00054 failures per km per year for pipelines and 0.000136 failures/well/year for well head Unlikely to extremely unlikely (one occurrence in 100 to 1,000,000 years) for pipeline rupture, likely to extremely unlikely (more than 1 occurrence in 100 to 1,000,000 years) for pipeline puncture	(Shell Canada Limited, 2011c, pp.4-87), (Shell Canada Limited, 2011a, pp.17-11), (U.S. Department of Energy, 2007, pp.S-73)	Limited (might only affect shallow groundwater formations) Effect of H ₂ S on human health: 0 to 52 adverse effects, 0 to 1 irreversible effects, 0 to 1 life threatening effects. Effect of CO ₂ on human health: 0 (site specific)	(Shell Canada Limited, 2011c, pp.4-87), (U.S. Department of Energy, 2007, pp.S-103)

Activity	Hazardous Events			Consequence	Reference	Probability	Reference	Magnitude	Reference
	Event	Description	Reference						
CO ₂ Injection	Hydraulic fracture through the caprock	Injection pressure and buoyancy effects might lead to opening up existing fractures/fault in the caprock. Injection pressure might also exceed the fracture pressure of the caprock, causing caprock fracture.	(Shell Canada Limited, 2010b, pp.5-9), (Lavoie and Keith, 2010, pp.6,7), (Goodarzi and Settari, 2009, p.17), (Shell Canada Limited, 2010a, pp.17-6), (U.S. Department of Energy, 2007, pp.S-61), (Wilson and Monea, 2004,	CO ₂ or brine leakage	(Lavoie and Keith, 2010, p.7), (Wilson and Monea, 2004, pp.30,215,234-235)	Low	(Shell Canada Limited, 2010b, pp.5-9), (Shell Canada Limited, 2011a)	Depends on escape path characteristics and where CO ₂ or brine leak to	
CO ₂ Injection	Hydraulic fracture through the caprock	Vertical fracture extension in any cases above	(Shell Canada Limited, 2010c, p.45)	CO ₂ or brine leakage	(Shell Canada Limited, 2010c, p.45)	Low	(Shell Canada Limited, 2010c, p.45)	Depends on escape path characteristics and where CO ₂ or brine leak to	
CO ₂ Injection	Fracture through the injection well	Injection pressure and buoyancy effects might lead to opening up existing fractures/fault in the caprock and affect injection well integrity	(Shell Canada Limited, 2010c, pp.2-3)	CO ₂ or brine leakage	(Shell Canada Limited, 2010c, pp.2-3)	Low	(Shell Canada Limited, 2011a, p.62)	Depends on escape path characteristics and leakage target	

Activity	Hazardous Events			Consequence	Reference	Probability	Reference	Magnitude	Reference
	Event	Description	Reference						
CO ₂ Injection	Thermal fracture through the caprock	Thermal stresses are created in caprock when the injected CO ₂ is at a lower temperature than the reservoir. This can lead to the opening of existing fractures or the creation of new ones. Flow paths in the caprock can be created by fault reactivation, propagation of fractures, or shear failure of rock.	(Goodarzi and Settari, 2009, pp.5,6,20,25, 28~30)	CO ₂ or brine leakage	(Lavoie and Keith, 2010, p.7)			Depends on escape path characteristics and where CO ₂ or brine leak to	
CO ₂ Injection	Failure in injection well wellhead		(Shell Canada Limited, 2010a, pp.17-6), (U.S. Department of Energy, 2007, pp.S-63)	CO ₂ or brine leakage		Unlikely	(Shell Canada Limited, 2010a., pp.17-6)	Depends on escape path characteristics and where CO ₂ or brine leak to	
CO ₂ Injection	Failure in injection well casing or cementation	Micro annulus formation in the casing cement due to shrinkage and pressure and temperature conditions	(Shell Canada Limited, 2011a, p.76), (Dusseault et al., 2000)	CO ₂ or brine leakage		Low	(Shell Canada Limited, 2011a, p.76)	Depends on escape path characteristics and where CO ₂ or brine leak to	

Activity	Hazardous Events			Consequence	Reference	Probability	Reference	Magnitude	Reference
	Event	Description	Reference						
CO ₂ Injection	Failure in injection well casing	CO ₂ can affect elastomers used in the construction of wells. For example a reduction in pressure that is accompanied by a phase change can result in a large drop in temperature that could affect components used in wells construction.	(DET NORSKE VERITAS (DNV), 2011, pp.9,30~32)	CO ₂ or brine leakage				Depends on escape path characteristics and where CO ₂ or brine leak to	
CO ₂ Injection	Pressure induced surface uplift	Pressure build up, especially in vicinity of the injection well, causes ground surface deformation. The uplift might lead to the creation of leakage pathways in wells.	(Shell Canada Limited, 2010c, pp.5-10), (Shell Canada Limited, 2011a, p.71), (Nygaard, 2010, p.18), (DET NORSKE VERITAS (DNV), 2011,	Effect on groundwater flow patterns, rate, or chemistry	Quest Project, Additional Information on ERCB Application No 1670112, December 2011, Page 71	Low Low (probability of significant deformation so that groundwater could be affected)	(Shell Canada Limited, 2010c, pp.5-10), (Shell Canada Limited, 2011a, p.71)	Geomechanical modelling using site rock properties show a insignificant maximum uplift of 60mm Low	(Shell Canada Limited, 2010c, pp.5-10), (Shell Canada Limited, 2011a, p.71)
CO ₂ Injection	Lateral migration of CO ₂ or brine within the storage system	Through any possible pathway	(Shell Canada Limited, 2010c, pp.5-10)	Displace the fluids towards leakage pathways	(Shell Canada Limited, 2010c, pp.5-10)	Low	(Shell Canada Limited, 2010c, pp.5-10)		
CO ₂ Injection	Human exposure to chemicals	Potential NO _x and PM _{2.5} emissions	(Shell Canada Limited, 2011c, pp.3-159)	Depends on time and amount of exposure	(Shell Canada Limited, 2011c, pp.3-188,189,194)			Negligible (given conditions in Shell Quest project)	(Shell Canada Limited, 2011c, pp.3-202)

Activity	Hazardous Events			Consequence	Reference	Probability	Reference	Magnitude	Reference
	Event	Description	Reference						
CO ₂ Injection	Loss or reduction of integrity of injection wells	A cycling of temperatures and pressures could affect the integrity of the injection well.	(Lavoie and Keith, 2010, p.8),(DET NORSKE VERITAS (DNV), 2011, p.30-32)	Leakage of CO ₂ (or brine) from storage reservoir	(Lavoie and Keith, 2010, p.7),(Nygaard, 2010, p.7)			Depends on escape path characteristics and where CO ₂ or brine leak to	
CO ₂ Injection	Loss or reduction of integrity of injection wells	The degradation of wells can take the form of the yielding or cracking of components due to temperature changes.	(DET NORSKE VERITAS (DNV), 2011, p.30-32)	Leakage of CO ₂ (or brine) from storage reservoir				Depends on escape path characteristics and where CO ₂ or brine leak to	
CO ₂ Injection	Induced seismicity	Seismic events can open up existing fractures / faults.	(Quintessa, 2012), (Verdon et al., 2010, p.1)	Damage to buildings, farmlands, etc. Creation of leakage	(Verdon et al., 2010, p.1)	Low (site specific)	(U.S. Department of Energy, 2007, pp.S-81)	Low (site specific)	(U.S. Department of Energy, 2007, pp.S-81)
CO ₂ Injection	Induced seismicity	Opening of fractures Damage to injection wells and the caprock. Pore pressure changes might affect the stresses leading to the reactivation of existing faults damaging wellbore.	(DET NORSKE VERITAS (DNV), 2010, p.74), (Wilson and Monea, 2004, p.221), (Prestona et al., 2005, pp.1563,1565), (Nicot and Duncan, 2012, pp.358,359)	CO ₂ or brine leakage	(Mazzoldi et al., 2012)	Low (site specific)	(U.S. Department of Energy, 2007, pp.S-81)	\$2 < M < 3.9\$ Low (site specific)	(Mazzoldi et al., 2012), (U.S. Department of Energy, 2007, pp.S-81)

Activity	Hazardous Events			Consequence	Reference	Probability	Reference	Magnitude	Reference
	Event	Description	Reference						
CO ₂ Injection	Reservoir injectivity could be less than expected	<p>More wells needs to be drilled to keep the injection rate as expected.</p> <p>Capacity estimates could have overestimated the true capacity of reservoir. The CO₂ would have no place to be stored.</p>	(Shell Canada Limited, 2010c, pp.4-2), (DET NORSKE VERITAS (DNV), 2010, p.74)	Because of the minimum required distance between the wells (to avoid pressure interference), CO ₂ footprint increases. This increases the chance for encountering leakage pathways.	(Shell Canada Limited, 2010c, pp.4-2)	Low	(Shell Canada Limited, 2011c, pp.4-133)		
CO ₂ Injection	Reduced injectivity over time	Salt precipitation might occur within a small radius from the injection well (~15m)	(Shell Canada Limited, 2011a, p.66),	Over time the ability to inject CO ₂ could be reduced, affecting the amount of CO ₂ that can be stored.	(DET NORSKE VERITAS (DNV), 2010, p.74)	Low	(Shell Canada Limited, 2011a, p.66)		
Long Term Storage	Loss or reduction of integrity of the caprock	CO ₂ dissolution acidifies the brine. Chemical reactions with the seal might have the potential to increase (or decrease) permeability of the seal.	(Shell Canada Limited, 2010c, pp.5-10), (Shell Canada Limited, 2010a, pp.17-6), (Wilson and Monea, 2004, p.221), (U.S. Department of Energy, 2007, pp.S-61)	Corrosion of the seal which might lead to CO ₂ or brine leakage	(Shell Canada Limited, 2010c, pp.5-10)	Low	(Shell Canada Limited, 2011a, p.40)		
Long Term Storage	Loss or reduction of integrity of the caprock	CO ₂ causes the dehydration of the shale caprock causing it to shrink, reducing the pressure required to fracture the caprock.	(Liu et al., 2012, p.163)	CO ₂ or brine leakage	(Liu et al., 2012, p.163)				

Activity	Hazardous Events			Consequence	Reference	Probability	Reference	Magnitude	Reference
	Event	Description	Reference						
Long Term Storage	Loss or reduction of integrity of the caprock	External forces such as earthquakes and alleviation due to stresses might affect caprock integrity.	(U.S. Department of Energy, 2007, pp.S-61)	CO ₂ or brine leakage	(U.S. Department of Energy, 2007, pp.S-61)	Small Possible but not common (site specific)	(U.S. Department of Energy, 2007, pp.S-61) (U.S. Department of Energy, 2007, pp.S-80)	Small	(U.S. Department of Energy, 2007, pp.S-61)
Long Term Storage	CO ₂ or brine migration through the caprock	CO ₂ can escape the injection formation through fractures or faults in the caprock	(Ghaderi and Leonenko, 2009, p.18), (DET NORSKE VERITAS (DNV), 2010, pp.14,24,58,74), (Prestona et al., 2005, pp.1563,1564), (Wilson and Monea, 2004, pp.30,215,234-235), (Nicot and Duncan, 2012,	Contamination of potable water, human exposure, CO ₂ leakage into homes/buildings through foundations, mitigation of GHG reduction targets	(Nygaard, 2010, p.5), (Wilson and Monea, 2004, pp.213,238~240)	Low (site specific)	(U.S. Department of Energy, 2007, pp.S-83)		

Activity	Hazardous Events			Consequence	Reference	Probability	Reference	Magnitude	Reference
	Event	Description	Reference						
Long Term Storage	Capillary CO ₂ or brine migration through the caprock	CO ₂ can escape the injection formation	(Shell Canada Limited, 2010c, pp. 5-11), (U.S. Department of Energy, 2007, pp.S-61)	CO ₂ or brine leakage	(Shell Canada Limited, 2010c, pp.5-11)	Low	(Shell Canada Limited, 2010c, pp.5-10)	In Quest site conditions, capillary migration of fluids from the caprock (in case injection pressure exceeds the capillary entry pressure of the caprock) takes hundreds of years and migration flux would be very small. However, localized heterogeneities in the caprock could result in higher local rates.	(Shell Canada Limited, 2010c, pp.5-11)
Long Term Storage	Molecular CO ₂ or brine diffusion through the caprock	CO ₂ might diffuse through the caprock in a molecular level, regardless of presence or absence of an interconnected pore space	(Shell Canada Limited, 2010 c, pp.5-11), (Shell Canada Limited, 2011a, p.48), (Wilson and Monea, 2004, p.234)	CO ₂ or brine leakage	(Shell Canada Limited, 2010c, pp.5-11)	Low Very unlikely	(Shell Canada Limited, 2010c, pp.5-10), (Shell Canada Limited, 2011a, p.48)	Low	(Shell Canada Limited, 2010c, pp.5-10)
Long Term Storage	Corrosion of injection well cementation	CO ₂ dissolution acidifies the brine which can cause cementation corrosion.	(Shell Canada Limited, 2011c, pp.3-104), (U.S. Department of Energy, 2007, pp.S-61)	CO ₂ or brine leakage	(Shell Canada Limited, 2010 c, pp.5-8)	Very unlikely	(Shell Canada Limited, 2011 c, pp.3-104)	Depends on escape path characteristics and where CO ₂ or brine leak to	

Activity	Hazardous Events			Consequence	Reference	Probability	Reference	Magnitude	Reference
	Event	Description	Reference						
Long Term Storage	Degradation of abandoned well cementation	Degradation of Abandoned well cement can occur in the presence of Magnesium Chloride, sulphates, fatigue, carbonation, leaching	(DET NORSKE VERITAS (DNV), 2011, p.30~32), (Wilson and Monea, 2004, p.242)	CO ₂ or brine leakage	(Shell Canada Limited, 2010 c, pp.5-3)			Depends on escape path characteristics and where CO ₂ or brine leak to	

Activity	Hazardous Events			Consequence	Reference	Probability	Reference	Magnitude	Reference
	Event	Description	Reference						
Long Term Storage	Leakage of CO ₂ or brine through wells	Leakage through wells (abandoned, injection, exploration, monitoring) can be caused by degradation of cement, fractures in cement, interfaces between materials in wells, corrosion of the casing.	(Shell Canada Limited, 2010c, pp.2-3) (Nygaard, 2010, pp.5-18,30), (DET NORSKE VERITAS (DNV), 2011, pp.18,19,30~32), (Ghaderi and Leonenko, 2009, p.18),(DET NORSKE VERITAS (DNV), 2010, pp.14,23,24,58,74), (DET NORSKE VERITAS (DNV), 2011, p.30~32), (U.S. Department of Energy, 2007, pp.S-61,63,73), (Wilson and Monea, 2004, pp.215,224,226), (Prestona et al.,2005	CO ₂ or brine leakage Contamination of groundwater, soil or emission into atmosphere Contamination of potable water	(Lawton et al., 2010, p.3), (Nygaard, 2010, p.5), (Nicot and Duncan, 2012, pp.356,358)	Low	(Shell Canada Limited, 2011a), (U.S. Department of Energy, 2007, pp.S-83)	Impact of H ₂ S leakage from the wells: 0.3 to 26 adverse effects.	(U.S. Department of Energy, 2007, pp.S-104)

Activity	Hazardous Events			Consequence	Reference	Probability	Reference	Magnitude	Reference
	Event	Description	Reference						
Long Term Storage	Migration of CO ₂ or brine to above the final seal	Leakage could happen into hydrocarbon resources.	(Shell Canada Limited, 2010c, pp.5-2), (Shell Canada Limited, 2011c, pp.3-83)	Salinity or acidity of hydrocarbon reservoir could increase.	(Shell Canada Limited, 2010c, pp.5-2), (Shell Canada Limited, 2011c,	Low	(Shell Canada Limited, 2010c, pp.5-2), (Shell Canada Limited, 2011c,		
Long Term Storage	Migration of CO ₂ or brine to above the final seal	Saline water could leak into protected ground water zone	(Shell Canada Limited, 2010c, pp.2-2,5-3)	Potential consequences to the groundwater are discussed in the environmental assessment	(Shell Canada Limited, 2010c, pp.5-3)	Unlikely (brine leakage) Low (affecting groundwater)	(Shell Canada Limited, 2011a, p.21), (U.S. Department of Energy, 2007, pp.S-83)	Depends on release rate and volume, pressure and temperature, aquifer mineralogy and hydraulic parameters, groundwater gradients and velocities, etc.	(Shell Canada Limited, 2011c, pp.3-113)
Long Term Storage	Migration of CO ₂ or brine to above the final seal	Soil could be contaminated. Migration of CO ₂ into the soil may increase soil acidity and introduce contaminants mobilized and transported by the passage of CO ₂ through the subsurface.	(Shell Canada Limited, 2010c, pp.5-3)	Resulting changes in soil quality could harm the "flora and fauna".	(Shell Canada Limited, 2010c, pp.5-3)				
Long Term Storage	Migration of CO ₂ or brine to above the final seal	CO ₂ could be released to the atmosphere.	(Shell Canada Limited, 2010c, pp.5-3)	In addition to other mentioned leakage consequences (e.g. air quality), project effectiveness in mitigating the global warming reduces.	(Shell Canada Limited, 2010c, pp.5-3)	Unlikely	(Shell Canada Limited, 2011a, p.19)		

Activity	Hazardous Events			Consequence	Reference	Probability	Reference	Magnitude	Reference
	Event	Description	Reference						
Long Term Storage	Migration of CO ₂ or brine because of third party activities	Activities such as mining, agriculture, or landfill	(Shell Canada Limited, 2010c, pp.5-10), (Wilson and Monea, 2004, p.221), (Prestona et al., 2005, p.1565)	Loss of containment	(Shell Canada Limited, 2010c, pp.5-10)				
Long Term Storage	Unexpected plume migration	Loss of conformance	(Shell Canada Limited, 2011a), (Wilson and Monea, 2004), (Nicot and Duncan, 2012, p.358)	Contamination of fresh water resources Loss of containment	(Shell Canada Limited, 2011c, pp.3-148) (Shell Canada Limited, 2010 c, pp.5-	Low	(Shell Canada Limited, 2011a)		
Long Term Storage	Contamination of groundwater with heavy metals	CO ₂ dissolution acidifies the groundwater. Acid can react with alkaline in the groundwater formation and release materials containing heavy metals	(Shell Canada Limited, 2011c, pp.3-148)	Contamination of fresh water resources	(Shell Canada Limited, 2011c, pp.3-148)	Low (for shallow water formations)	(Shell Canada Limited, 2011c, pp.3-149)		

Activity	Hazardous Events			Consequence	Reference	Probability	Reference	Magnitude	Reference
	Event	Description	Reference						
Long Term Storage	Escape of H ₂ S (Hydrogen Sulphide)	H ₂ S may be present in the resident brine and could escape the storage aquifer via brine leakage	(Lavoie and Keith, 2010, pp.5,6), (Ghaderi and Leonenko, 2009, pp.19,20), (DET NORSKE VERITAS (DNV), 2011, pp.30,32)	Cracking / Fouling	(DET NORSKE VERITAS (DNV), 2011, pp.9,30~32)				
Long Term Storage	Presence of other chemicals in CO ₂ stream	Oxygen, Hydrogen, etc. Oxygen may promote corrosion.	(DET NORSKE VERITAS (DNV), 2011, pp.9,30~32)	Degradation of existing wells, leading to leakage.	(DET NORSKE VERITAS (DNV), 2011, pp.9,30~32)
